Model-based Prediction and Control

1.1 Markov Chain

1.2 Markov Reward Process

1.3 Sampling. Een voorbereiding voor Monte-Carlo Policy Evaluation

Discount = 1

Rain -> Rain -> Cloudy -> sunny -> meteor
$$0 + (1^1 -2) + (1^2 +0) + (1^3 +3) + (1^4 +10) = -9$$
 sunny -> sunny -> sunny -> meteor $0 + (1^1 +3) + (1^2 +3) + (1^3 +3) + (1^4 +10) = -1$

1.4 De value-function bepalen

$$\gamma=1\gamma=1$$
 $V(s)=E[G_t|S_t=t]$

Iteration	Rain	Cloudy	Sunny	Meteor
0	0	0	0	0
1	-1.8	0.5	0.8	0
2	-3.37	0.63	1.43	0

1.5 Zelf-onderzoek

- De reward is onbegrensd en wordt daardoor eindeloos. [1]
- Het zorgt ervoor dat er geen focus gelegd kan worden op long-term en of short-term goals. [1]

2. Control met Value Iteration

Iteration	L	М	R
0	0	0	0
1	-0.1	-0.55	0
2	-0.65	-1	0
3	-1.1	-1	0
4	-1.1	-1	0
5	-1.1	-1	0

Ik ben gestopt met value iteration omdat er geen verandering meer is.
